of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart, and skeletal muscle disorders hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    26-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               proteins, or as specific biomolecule capture probes

                        The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantity hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption deficiency in hGDMLP-1 production, and in vaccines or for replacement the harmonic proteins and for replacement and for repl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               30-JAN-2001;

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention.
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of
                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1 -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise CC concentration and/or amount specifically of hGDMLP proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific clincolecule capture probes for surface-enhanced laser description CC ionisation, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC particular heart and skeletal muscle disorders. hGDMLP-1 is localised to CC chromosome 22. The present sequence represents an ollgomer used in the Screening of the hGDMLP-1 sequence in the exemplification of the present convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC protein 1 (h@pMLP-1). The protein and polynucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and Cf for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC be used as immunogens to raise antibodies that specifically recognise CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific CC concentration and/or amount specifically of hGDMLP proteins, as specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC therapy. The polymucleotide supplement in patients having specific CC diagnosing a disorder associated with the expression of hGDMLP-1 in CC chromosome 22. The present sequence servennist an oligomer used in the present sequence represents an oligomer used in the present sequence in the acceptance of the hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                 cc and quantify himself in uncleic acids in samples, as amplification of the provide initial substrates for the recombinant engineering cc of hGDMLP-1 protein variants having desired phenotypic improvements, and cf or expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption concentration, as therapeutic supplement in patients having specific concentration, as therapeutic supplement in patients having specific consistion, as therapeutic supplement in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in consistency in holds a decided muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the sorresing of the hGDMLP-1 sequence in the exemplification of the present

                                                                                                                  CC protein 1 (homeles). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The characterise complete in the sequences of hGDMLP-1 nucleic acids can be used as probes to detect, characterise complete in the control of the protein control of the complete in the recombinant engineering confugnation to rations having desired phenotypic improvements, and confugnation variants having desired phenotypic improvements, and confugnation to raise antibodies that specifically recognise concentration and/or amount specifically of hGDMLP-1 proteins, as specific hGDMLP-1 proteins, as specific concentration, as therapeutic supplement in patients having specific concisation, as therapeutic supplement in patients having specific consistation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for charmosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present

CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP, proteins, as specific biomolecule capture probes for surface-enhanced laser desorption CC ionisation, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the greening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABN10709
 invention.

N.B. The sequence data for this patent did not consistent on, but was obtained in electronic consistent.
                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human
                                                                                                                                                                                                                                                                                                                                           The present invention describes a human genome-derived myosin-like

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SX
The invention relates to a nucleic acid molecule (I) which down regulates CC expression of an Ets-related gene (ERG). (I) is useful for treating CC conditions selected from cancer, lymphoma, Ewing's sercoma, melanoma, CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge CC weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for CC treating a patient having a condition associated with the level of ERG, CC by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies CC under conditions suitable for the treatment. Leukaemia or tumour CC angiogenesis is treated by administering (I) to the patient in CC conjunction with one or more of other therapies such as radiation or CC conjunction with one or more of other therapies such as radiation or CC conjunction with one or more of other therapies such as radiation or CC cll, by contacting the cell with (I). (I) is useful for cleaving RNA of CC ERG gene, by contacting (I) with RNA, in the presence of a divalent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 0.9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK2719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and
                                                                                                                                                                               Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulga; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozym

                                                                                                                                                                                                                                                                       ÀM,
```

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retrinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca yulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge

down regulates

Claim 4; Page 81; 149pp; English.

Weber syndrome, Kippel-Trenaunay-Weber syndrome, Oslusyndrome, leukaemia, osteoporosis and wound healing.

Osler-Weber-rendu ing. (I) is useful

for ERG

condition associated

```
the treatment. The method comprises the use of one or more therapies cunder conditions suitable for the treatment. Leukaemia or tumour cangiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of CR gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and classes related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. CRAN17354-ABK2719 represent nucleic acids, including antisense and cenzymatic nucleic acid molecules which regulate expression of ERG, and carried PCR primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC treating a patient having a condition associated with the level of ERG, CC by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies CC under conditions suitable for the treatment. Leukaemia or tumour CC angiogenesis is treated by administering (I) to the patient in CC conjunction with one or more of other therapies such as radiation or CC chemotherapy treatment. (I) is useful for reducing ERG activity in a CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of CR gene, by contacting (I) with RNA, in the presence of adivalent CC cation such as Mg2+. (I) is useful for diagnosis of conditions and CC classes related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically CC targeting genes that share homology with ERG gene or ERG fusion genes. CABK17354-ABK22719 represent nucleic acids, including antisense and CC enzymatic nucleic acid molecules which regulate expression of ERG, and conjunction and conjunction and conjunction and conjunction and conjunction and conjunction and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 0.9%;

given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acide, polypeptides, vectors containing the nucleic acide, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense; sense; tumour; cell degeneration; cancer; Alzheimer schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                            given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antiense; sense; tumour; cell degeneration; cancer; Alzhelmer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17 BP; 4 A; 3 C; 4 G; 6 T; 0 other;

ID ABT34848 standard; DNA; 17
The invention relates to a novel isolated 17 mer nucleic acid sequence, CG given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel the complement of any of them, or the corresponding RNA. The novel generated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of agency chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches 14;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                           Disclosure;

ABT35043/c
The invention relates to a novel isolated 17 mer nucleic acid sequence, consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a coptimal alignment, at least 80 % identity to the 17 mer sequence, a coptimal alignment, at least 80 % identity to the 17 mer sequence, a coptimal alignment at least 80 % identity to the 17 mer sequence, a coptimal alignment of any of them under highly stringent conditions, or the complement of any of them under highly stringent conditions, or the complement of any of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, coption of recombinate polypeptides. Any of the nucleic acid, coption and for production of recombinant polypeptides. Any of the nucleic acids, copypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral copyperides that are characterised by development of tumours or cell copyperides and specifically cancer but also Alzheimer's disease and schizobrenia. Analysis of the expression of the 17 mer nucleic acids in copypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ព្រព្ពಜ្ណ
            CC given in the specification, a sequence containing at least 15
CC consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel consolated mucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, cc e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cells containing the cc vector or antibodies directed against the polypeptides are useful for cc preparation of pharmaceuticals for prevention and/or treatment of viral cdiseases that are characterised by development of tumours or cell cdiseases that are characterised by development of tumours or cell cdiseases that are characterised by development of tumours or cell containing the sequence of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein characterised by development of these containing the invention can be used in gene containing the containing the polypeptides can also be used to generate antibodies, and contains of protein contains o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17 BP; 2 A; 6 C; 2 G; 7 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           á
         CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or cc sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers corresponding RNA is probes and primers of the component of a gene chip, in vitro as (anti) sense reagents, can for production of recombinant polypeptides. Any of the nucleic acids, collypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cliescases that are characterised by development of themours or cell cliescases that are characterised by development of themours or cell capatient samples is useful for diagnosis and/or prognosis of these conficients are useful as components of protein chips. The polypeptides can also be used to generate antibodies, and confice the polypeptide and antibodies are useful as components of protein charge. This polymucleotide sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                   CC given in the specification, a sequence containing at least 15 sequence, consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a cc sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel consolated nucleic acids of the invention are useful as probes and primers corrected for detecting, identifying, quantifying and/or amplifying a nucleic acid, cc. as one component of a gene chip, in vitro as (anti)sense reagents, cc and for production of recombinant polypeptides. Any of the nucleic acid, cc. and for production of recombinant polypeptides are useful for polypeptides are useful for containing the nucleic acids, cc. and for production of pharmaceuticals for prevention and/or treatment of viral containing the nucleic acids of preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell containing the sequence but also Alzheimer's disease and containing the sequence of the 17 mer nucleic acids in serior sequences. The polypeptides can also be used to generate antibodies, and containing the invention can be used in generate antibodies are useful as components of protein characterise acid sequences of the invention can be used in generate antibodies. The nucleic acid sequences of the invention can be used in generate antibodies acid sequences of the sequences of the sequences of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated 17 mer nucleic acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 148;

                                                       The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a cc sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel cisolated nucleic acids of the invention are useful as probes and primers condetecting, identifying, quantifying and/or amplifying a nucleic acid, cc and for production of recombinant polypeptides. Any of the nucleic acids, ccl as one component of a gene chip, in vitro as (anti)sense reagents, cc and for production of recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cliesases that are characterised by development of tumours or cell capeneration, specifically cancer but also Alzheimer's disease and conjugation to separate antibodies is useful for diagnosis and/or prognosis of these conjugations are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene conjugated human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                              given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                                                        degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosts and/or prognosts of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                     CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after CC optimal alignment, at least 80 % identity to the 17 mer sequence, a containing at least 15 coptimal alignment, at least 80 % identity to the 17 mer sequence, a containing at least 15 coptimal alignment, at least 80 % identity to the 17 mer sequence, a coptimal alignment, at least 80 % identity to the 17 mer sequence, a coptimal alignment of any of them under highly stringent conditions, or the complement of any of the mention are useful as probes and primers for detecting, identitying, quantifying and/or amplifying a nucleic acid, copy and for production of recombinant polypeptides. Any of the nucleic acids, collypeptides, vectors containing the nucleic acids, rector or antibodies directed against the polypeptides are useful for copparation of pharmaceuticals for prevention and/or treatment of viral conseases that are characterised by development of tumours or cell containing the expression of the 17 mer nucleic acids in containing the expression of the 17 mer nucleic acids in containing the expression of the 17 mer nucleic acids in containing the expression of the sequences of these containing the collection and containing the collection and containing the expression of the 17 mer nucleic acids in components of these collections and containing the collection of the polypeptides can also be used to generate antibodies, and containing the collection of the polypeptide and antibodies are useful as components of these collections. The nucleic acid sequences of the invention can be used in gene containing the collection of the invention can be used in gene containing the collection of the invention can be used in gene containing the invention can be used i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                                                                                                                                                CC given in the specification, a sequence containing at least 15
CC consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a cc sequence that hybridizes to them under highly stringent conditions, or CC the complement of any of them, or the corresponding RNA. The novel cisolated nucleic acids of the invention are useful as probes and primers CC for detecting, identifying, quantifying and/or amplifying a nucleic acid, ce.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acid, cc golypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for c proparation of pharmaceuticals for prevention and/or treatment of viral cdiseases that are characterised by development of tumours or cell containing the schizophrenia. Analysis of the expression of the 17 mer nucleic acids in CC diseases. The polypeptides can also be used to generate antibodies, and coths the polypeptide and antibodies are useful as components of these caid sequences of the invention can be used in gene cherapy. This polynucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention.
                                                                    Matches
                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                            CC given in the specification, a sequence containing at least 15
CC consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel complement of any of them, or the corresponding RNA. The novel conditions is contained by the invention are useful as probes and primers corresponding RNA to a nucleic acid, or detecting, identifying, quantifying and/or amplifying a nucleic acid, or and for production of recombinant polypeptides. Any of the nucleic acid, and for production of recombinant polypeptides and containing the vector or antibodies directed against the polypeptides are useful for diseases that are characterised by development of tumours or cell containing the nucleic acid, and preparation, specifically cancer but also Alzheimer's disease and component of the sequence of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein characterise acid sequences of the invention can be used in generate antibodies. The nucleic acid sequences of the invention can be used in generate antibodies.

                                                                                                                                                                                      degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                       given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by dependent of tumours or conditional degeneration. Specifically cancer but also Alzhaimer's disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                                                                                                                                  CC given in the specification, a sequence containing at least 15
CC consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel complement of any of them, or the corresponding RNA. The novel complement of any of the invention are useful as probes and primers of retecting, identifying, quantifying and/or amplifying a nucleic acid, ce g, as one component of a gene chip, in vitro as (anti)sense reagents, can for production of recombinant polypeptides. Any of the nucleic acids, collas containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for comparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell containing the separation, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in CR patient samples is useful for diagnosis and/or prognosis of these containing the polypeptides can also be used to generate antibodies, and the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene containing the contained human fukutin oligonucleotide of the invention.
                                                                        Matches

                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or cc the complement of any of them, or the corresponding RNA. The novel cisolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, ce.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of themours or cell caparistion, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in cellicates. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of these chips. The nucleic acid sequences of the invention can be used in gene therapy. This polyrucleotide sequence represents a tumour suppression can be used in gene therapy. This polyrucleotide sequence represents a tumour suppression can be used in gene therapy. This polyrucleotide sequence represents a tumour suppression can be used in gene therapy. This polyrucleotide sequence represents a tumour suppression can be used in gene therapy. This polyrucleotide of the invention can be used in gene therapy. This polyrucleotide of the invention can be used in gene therapy. This polyrucleotide of the invention can be used in gene therapy. This polyrucleotide of the invention can be used in gene therapy. This polyrucleotide of the invention can be used in gene therapy.

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells -

Disclosure; Page 666; 720pp; French.

CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after coptimal alignment, at least 80 % identity to the 17 mer sequence, a coptimal alignment of any of them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel consisted nucleic acids of the invention are useful as probes and primers copy of them, or the corresponding RNA. The novel copy of the invention are useful as probes and primers copy as one component of a gene chip, in vitro as (anti)sense reagents, copy as one component of a gene chip, in vitro as (anti)sense reagents, copy and for production of recombinant polypeptides. Any of the nucleic acids, copy peptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for corparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tunours or cell diseases that are characterised by development of tunours or cell containing the 17 mer nucleic acids in copy of the sequence of the 17 mer nucleic acids in copy of the polypeptides can also be used to generate antibodies, and copy peptides are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene contained the copy of the components of protein copy of the copy of t The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15

The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, ce.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, ce.g. as one component of a gene chip, in vitro as (anti)sense reagents, ce golypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tunours or cell caparation, specifically cancer but also Alzheimer's disease and components of these containing the sequences of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these containing the polypeptides can also be used to generate antibodies, and coips. The nucleic acid sequences of the invention can be used in gene chips. NFKB sub-unit modulating inozyme substrate

#664

03-JUN-2003

(first entry)

```
CC (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in Ct the presence of a divalent cation, especially Mg^2-+. The enzymatic and cantisense nucleic acid molecules are useful for treating breast, lung, CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cc cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or cmultidrug resistant cancer. The method involves use of other drug complete such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cc gemeitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as the chematoid arthritis, restenosis, asthma, Crohn's disease, diabetes, cobesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-AUG-1994;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lung cancer; prostate cancer; colorectal cancer; brain cancer; cesphageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; varian cancer; pencreatic cancer; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplattin; methotrexate; cyclophosphamide; doxorubin; fluororuracil carboplatin; edatrexate; gemcitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reparfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inczyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 3; Page 36; 72pp; English.

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, Zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and cantisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug characters such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, generitable or radiation therapy. The enzymatic and antisense nucleic conditions are such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, generitable or radiation therapy. The enzymatic and antisense nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; osophageal cancer; stomach cancer; bladder cancer; parceatic cancer; corvical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; edatrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; edatrexate; sementabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection;

                       The invention relates to a novel stabilising reaction reagent for use in the amplification and/or detection of a target nucleic acid comprising: preparing a reaction mixture with e.g. a nucleic acid as template, at least 1 primer and RNaseH; and incubation of the reaction mixture for a defined period of time to form a reaction product during the amplification of such target nucleic acid. The method is useful for stabilising and long-term storage of reaction reagents for highly sensitive and specific amplification and detection of nucleic acids particularly in identifying pathogenic microorganisms or viruses in a sample using chimeric oligonucleotide primers, which is useful in genetic engineering and clinical medicine. This polynucleotide sequence represents an oligo relating to the novel stabilising reaction reagent method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes obesity, autoimmune disease, lupus, multiple sclerosis, transplant, rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel
                                                                                                                                                                                                                                                                                       Method for stabilizing and storing reaction reagents for specific amplification and detection of nucleic acids particularly in e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Stabilising reaction reagent; PCR; primer; RNaseH; long-term specific amplification; pathogenic microorganism; chimeric; genetic engineering; clinical medicine; ss.
                                                                                                                                                                                                                                                                                                                                       WPI; 2003-148805/14.

                                                                                                                                                  acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-F human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-Heumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ6216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66530 - ABZ66585 represent substrate/target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ6544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66520 - ABZ665230 - ABZ665285 represent substrate/target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule. That modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59389 - ABZ65216, ABZ64344 - ABZ65531, ABZ65520 - ABZ65520 - ABZ65524 - ABZ65531, Description of the sequences shown in ABZ59389 - ABZ65585 represent substrate/target

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-H human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66520 - ABZ66520 - ABZ665230 - ABZ66530 - ABZ66530 - ABZ66585 represent substrate/target
                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Rahuman immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and
                                                                                                                                                                                                                                                                                               Mcswiggen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ភភភភន្ត្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABF00010-ABF99893, ABH00010-ABH99989 and ABI00010-ABH829898, The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     prostate, bladder, or pancreatic cancer, and HIV infection, and AID: The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI32073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                 Oligonucleotide SEQ ID NO 76799 for detecting SNP TSC0019618

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABP00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fig. wipo.int/pub/published_pct_sequences.

The oligonucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABLO0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABH00010-ABH99989 and the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Set of oligonucleotides, useful for diagnosis and cell typing, designed to detect single nucleotide polymorphisms and cytosine

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABF0010-ABF9989, ABH0010-ABH9989 and ABI00010-ABH82073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

ftp.wipo.int/pub/published_pct_sequences.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABF00010-ABF99889, ABH00010-ABH9989 and ABI00010-ABG99899, are present the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 represent the oligomers described in the invention:

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.
ABC00010-ABC99999, ABF00010-ABF99989, ABF00010-ABF99989 and ABF00010-ABF99989, ABF00010-ABF99989 and peresent the oligomers described in the invention.
NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Set of oligonucleotides, useful for diagnosis and cell typing, designed to detect single nucleotide polymorphisms and cytosine methylation status -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosiae methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a

                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide (I) comprising a CC nucleotide sequence which is a polymorphic variant of a reference concentration of a sequence for Selectin L Lymphocyte Adhesion Molecule 1 (SELI) gene. Selecting the useful for screening for drugs targeting the SELI polypeptide is useful for screening for drugs targeting the CC polypeptide. Oligonucleotides derived from (I) are used to target SELI cand a haplotype pair of SELI gene. These are useful in CC developing diagnostic tests and therapeutic treatments for neonatal pertussis (whooping cough) (I) is useful for studying the expression and function of SELI and expressing SELI protein for use in screening for candidate drugs to treat diseases related to SELI activity. The polymorphism and haplotype data are useful for validating whether SELI is a suitable target for drugs to treat whooping cough, screening for such drugs and reducing bias in clinical trials of such drugs. Establishing the SELI haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the SELI activity e.g. neonatal pertussis (whooping cough). The haplotyping method is useful to validate SELI as a candidate target for treating a specific condition or disease predicted to the associated with SELI activity and contains a predicted to the service with SELI activity and the service of the service
specific condition or disease predicted to be associated with SELL activity. The method is also useful in screening for compounds targeting SELL to treat a specific condition or disease predicted to be associated with SELL activity, e.g. detecting which of the SELL haplotypes or haplotype pairs present in individual members of a population with the specific disease of interest enables one to screen for compounds that display the highest desired agonist or antagonist activity for each of the most frequent SELL isoforms present in the disease population. A polymorphic variant of SELL is useful in studying the effect of the variation on the biological activity of SELL, on the binding affinity of candidate drugs targeting SELL for the treatment of neonatal pertussis (whooping cough) and in assays to measure the binding affinities of one or more candidate drugs targeting the SELL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel genetic variants of selectin L lymphocyte adhesion molecule 1 (SELL) gene useful for therapeutic purposes and for expressing SELL protein useful in identifying drugs to treat whooping cough -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim
